SUMMARY

Full-stack developer with 17 months of production experience in Java, Vue.js, and SQL on a commercial web platform. Promoted from intern to engineer after shipping 60+ features and fixes. I also build and run a review-gated AI agent workflow that raised my measured ticket throughput 4.1x.

EXPERIENCE

DOmedia | Columbus, OH — April 2025 – Present

Inventory Specialist (Part-time) — *September 2026 – Present*

Software Engineer — *June 2026 – September 2026*

Software Development Intern — *April 2025 – May 2026*

- Shipped 60+ features and bug fixes on a Java (Spring MVC), Vue.js, and MariaDB platform that national ad agencies and media vendors use daily to plan, buy, and contract outdoor advertising.
- Built a Contract Search page with Excel-style column filters for an agency client, behind its own permission so it could be turned on for only the users who asked for it.
- Split proof-of-performance reminder settings into separate Static and Digital rules, and added a Never/Daily/Weekly contract reminder option that kept every company's existing setting.
- Fixed a CSV import that silently skipped existing records. It now updates and inserts, and returns a downloadable file of any rows it could not read.
- Found a report download with no ownership check while fixing an unrelated bug, and closed it.
- Added a new photosheet layout to the PowerPoint export, built to the mockup's exact type sizes.
- Set up an AI agent workflow where every change passes independent code, security, and QA review plus a live browser check before I open the pull request. Measured ticket throughput rose 4.1x.
- Rehired part-time as Inventory Specialist: answer client inventory questions, upload clients' inventory for them, write process documentation, and look for ways to streamline and automate the upload process.

PROJECTS

Isometric Action RPG | C#, .NET, Godot 4, Lua — github.com/nathanielwhittaker/arpg-devlog

- Solo-built game with a skill system, randomized loot, monster packs, a streaming multi-zone world, towns, vendors, and saves.
- The simulation is a plain .NET library with no engine dependency: fixed-point math, one seeded RNG, fixed timestep. The same seed produces a byte-identical world, enforced by 4,600+ tests.
- Items, monsters, and classes are data loaded through a sandboxed Lua mod system. The base game is the first mod, so a new damage type needs no engine changes.
- About 500 pull requests merged, each through the full test suite and independent reviews. 170+ architecture decision records.

PoeTicketQueue | Java 21, Spring Boot 3, Vue 3, Docker — github.com/nathanielwhittaker/PoeTicketQueue

- Web app that lets a gaming group queue item requests for its traders, with join codes, roles, trade-style search filters, and Discord notifications. CI publishes container images; deployed behind a Cloudflare Tunnel.

PoeBuildExporter | Java 17, Swing, Maven — github.com/nathanielwhittaker/PoeBuildExporter

- Desktop tool that parses character builds, queries the game's trade API within its rate limits, and exports a priced spreadsheet with a search link for every item.

SKILLS

Languages: Java, JavaScript, C#, SQL, Lua
Frameworks: Spring MVC, Spring Boot, Vue.js, .NET
Data and APIs: MariaDB, JPA (EclipseLink), Flyway migrations, REST, Swagger/OpenAPI
Tools: Git, Maven, Docker, GitHub Actions, Playwright, xUnit, Claude Code

EDUCATION

Franklin University | A.S. in Computer Science — In progress
